```

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present invention provides the protein and coding sequences of canine pro-endostatin and endostatin. The sequences can be used in the treatment and diagnosis of angiogenesis related disorders, including cancer, rheumatoid arthritis, poriasis, related disorders, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, calanglectasia, haemophiliac joints, angiofibroma, arteriovenous malformations, collaterals, cerebral collaterals, arteriovenous malformations, ischaemic limb angiogenesis, diabetic neovascularisation, and fractures. The present sequence is the canine pro-endostatin coding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    120

The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to cDNAs encoding them (ABQ54131-ABQ56305), and also encompasses polypeptides 90% identical and polynucleotides 5% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen polynucleotides, antibodies against human ovarian antigens, and the use of ovarian antigen polynucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer and breast cancer, and metastatic tunours of ovarian or breast crigin, reproductive system disorders (e.g., infertility, disorders of pregnancy, anovulation, polycystic ovary syndrome, ovarian cysts, and dysmenorrhoea), endocrine

```
disorders, infections (e.g., chlamydia, HIV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, cophoritis and vaginitis), immune disorders (e.g., congenital and acquired chimunodeficiencies, autolimmune opphoritis, systemic lupus erythematosus), comported chimunodeficiencies, autolimmune opphoritis, systemic lupus erythematosus), cophoritis, systemic lupus erythematosus), respiratory disorders (e.g., anaemia), cardiovascular disorders, respiratory disorders. Ovarian antigen polypeptides and uninary system disorders. Ovarian antigen polypeptides and opphoritis and action expression or activity. The polymucleotides may further be used for gene therapy, chromosome mapping, in the chartification of individuals and in forensic analysis, and the present seful in disease disgnosis, drug targeting and phenotyping. The present sequence represents cDNA encoding a human ovarian antigen of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp. wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          2386 CCCTGGCGGCAGATGACATCCTGGCCAGCCCCCTCGCCTGCCCGAGCCCCAGCCCTAC 2445
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2613
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   2446 CCCGGAGCCCGCACCACACAGCTCCTACGTGCACCTGCGGCCGGGCRCGACCCACAAG---- 2501

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel viral gene therapy vector comprising a nucleic acid molecule encoding an anti-angiogenic polypeptide chosen from human or murine andsostatin and angiogenesis-inhibiting fusions and fragments, where the viral vector is sufficiently attenuated for use in human gene therapy. The products of the invention have anti-angiogenic, cytostatic, anti-diabetic and ophthalmological activity. The vector is used in gene therapy for inhibiting tumour growth in humans harbouring a solid tumour. The vector expresses an anti-angiogenic polypeptide. An additional use comprises treatment of diabetic retinopathy, where the anti-angiogenic polypeptide inhibits angiogenesis in the vicinity of the retina. The vector is administered to cells ex
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           'n

It was isolated from a placental cDNA library using a probe based on an unidentified collagenous protein and a probe based on mouse alpha-1 cDNA clone mol9. A claimed plasmid comprising alpha-1 collagen nucleic acid and an expression control sequence can be used to express recombinant collagen in prokaryotic or eukaryotic (especially mammalian) host cells. The collagen may be used to treat a patient entire from a disease associated with degradation of cartilage, and for supplementing collagen 1 conseceedadandacarderecedecedecedecedecedadadadadecedadecenad 181 CTGAACAGCCCGCAGCCGGGCGGCATGCGAGGCATCCGGGGAGCGGACTTCCAGTGCTTC CAGGACCTCTACAGCATCGTGCGCCGCGCGACCGCACCGGGGGTGCCCGTCGTCAACCTC Nucleic acid encoding human alpha-1 collagen - for production of recombinant alpha-1 collagen, for use in the treatment of cartilage Match 59.9%; Score 496.8; DB 2; Length 3394; Local Similarity 77.1%; Pred. The method comprises identifying a compound having atomic coordinates with non-trivial similarity to selected coordinates of atoms of a mammalian endostatin involves (a) providing a library of atomic coordinates of compounds in a library of candidate compounds, (b) 756 Alpha1(XVIII) collagen; mimetic; endostatin; atomic coordinate; library; anti-angi-ogenic; heparin binding domain; receptor binding domain; mimic; alpha-helix A domain; carbohydrate recognition domain; CRD domain; treatment; angiogenesis; tumour; human; ss. 601 GGCAGGCTGCTGGAGCAGGAGGCCGCGAGCTGCCACGCCTTCGTGGTGCTCTCTGCATC 661 GAGAACAGCGTCATGACCTCCTTCTCCCAAGTAGGGCCGCGGGGGCCCACGGACAGGGGGG /product= "alpha1(XVIII) collagen" /note= "Partial sequence, no start codon given" 721 GAGGGGGGCCCCCAGGAGCATCCGCCGCCCCCGGGG-----Olsen BR, Hohenester E, Timpl R, Sasaki T; Identifying mimetics of mammalian endostatin. comparing the library of atomic coordinates to the selected coordinates of a mammalian endostatin and (c) selecting from the library at least one candidate compound on the basis of selection criteria which include similarities between the atomic coordinates of the selected candidate compound and the atomic coordinates of the mammalian endostatin. The invention also describes the use of an anti-anglogenic fragment of endostatin comprising a domain selected from a heparin binding domain, a receptor binding domain, and exposed on alpha-helix A domain, and a carbohydrate recognition domain (CRD) domain. The methods can be used for be used for treating undestred anglogenesis, e.g. tumours. This sequence encodes human alphal(XVIII) collagen which is used in the description of

Synthetic plasmid pEnd-HR#1 FPD fusion DNA sequence.

Mouse; Ig signal peptide; mIgSP; functional protein domain; FPD; primary translational product; PTP; DNA construct; regulatory DNA; DNA targeting segment; regulatory factor; single regulatory unit; monoclonal antibody; recombination-derived alteration; blood product; human; COL18A1; gene; mutant; fusion protein; ds.

The present invention relates to a new method of producing a protein, as such as functional protein domain, that is either C or N-terminus of the primary translational product (PTP) of a gene, where the protein has bological activity which is distinct from PTP. The method of the bological activity which is distinct from PTP. The method of the comprising a regulatory DNA and a DNA targeting segment. This method is useful for producing a functional protein Gomain of proteins such as regulatory blody products and monoclonal antibodies. The method described in the invention allows controlled and precise modification of the host call genome in order to produce functional protein domain (FPD) of the host call genome in order to preduce functional protein domain (FPD) of the amount of exogenous sequence to be integrated in the host call genome present in the host call genome trashif is used. Use of the host call genome companies the advantages of both eliminating any combination-derived alteration of such coding sequence, and also making use of the same post-transcriptional (e.g., splicing) and/or post-translational (e.g. glycosylation, phosphorylation) processes that are

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               comprising a DNA encoding an anti-angiogenic protein, which shows therapeutic effects on rheumatoid arthritis. The composition is useful for treating rheumatoid arthritis and the gene therapy is effective, lasting for 14 days. The present sequence is the coding sequence for human collagen XVIII. Endostatin, which consists of the C-terminal 183 residues of collagen XVIII, was used as an anti-angiogenic protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            4102 chachadeacacacarddaarraddadaachricaacarricaacarricaacard

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    120
   actually applied in vivo for the maturation of FDD. The use of a single regulatory unit eliminates the necessity of manipulating the complementary DNA coding for the PTP to isolate the segment coding for the PPD, and adapt it to the expression vector. The present nucleic acid sequence encodes the plasmid pEnd-HR#1 FPD fusion protein of the invention. The FPD fusion protein contains the mouse Ig signal peptide (mIgSP) sequence fused to exons 38-41 of the human COL18Al sequence
                                                                                                                                                                                                                                                                                                                                                                                                           9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             rereadacereceadescreerecerescences de recensor de la recensor de la consecución del consecución del consecución de la con

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         4401
cells expressing the polypeptide are useful in treating pancreatic cancer and stimulating an immune response. The polymuclectides can be used as probes or primers for nucleic acid hybridisation, in the design and preparation of ribozyme molecules for inhibiting expression of the tumour polypeptides and proteins in the timour cells, in vaccines and for gene therapy. Note: The sequence date for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at ftp.wipo.int/pub/published_pct_sequences

The present sequence encodes a fusion protein of vaa and endostatin. The specification describes a method for the production of soluble, recombinant human endostatin in Streptomyces. Leader sequences of streptomyces sp. strain CS SnpA and S. venezuelae alpha-amylase proteins are linked to the N-terminal of endostatin. This ensures that endostatin protein is produced as a secreted, soluble protein which needs no refolding, is stable in the fermentation broth and is produced in large quantities. The method is used for preparing soluble recombinant human, murine or primate endostatin, which is useful in the treatment of cancer, inhibition of tumour growth, inhibition of angiogenesis, isolation of receptors for endostatin and for identification of anti-angiogenic compounds in assays. The endostatin protein is produced as a secreted, soluble protein which needs no refolding, is stable in the fermentation broth and is produced in large quantities. Streptomycetes are amenable for cultivation in large fermentations allowing for large quantities of soluble endostatin to be produced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Preparation of soluble recombinant endostatin involves transforming Streptomycete host with expression vector comprising nucleotide sequence encoding endostatin operably linked to linker and leader peptide.
               Streptomyces sp. strain C5; SnpA; S. venezuelae; alpha-amylase; endostatin; cancer; tumour growth; angiogenesis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

This invention describes a novel method for the preparation of recombinant human vascular endothelial cytopoiesis inhibiting factor with human 1931FC fragment molecular structure and its product application. The novel factor is derived from endostatin (using PCR to screen a human foetal kidney cell cDNA library) and human IgGIFC. The product of the invention can specifically inhibit tumour vascular endothelial prolification and can be used for curing several tumour types. This sequence encodes a fusion construct composed of human endostatin and human IgGIFC, described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      319

A cDNA clone (AAT84485) codes for a mouse novel type alpha-1 (XVIII) collagen (AAM26328) that is expressed in multiple organs, especially the liver, lung and kidney. It was isolated by screening murine 15.5- and 17.5-day embryo libraries with probes based on murine type XII collagen and on human alpha-1 collagen cDNA. Isolated nucleic acids can be used to express recombinant alpha-1 collagen in transformed host cells. Claimed nucleic acid (see AAT84484) coding for human alpha-1 collagen (AAW26327) can be used to treat patients suffering from diseases associated with degradation of cartilage, and for supplementing collagen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                3184 CCCTGGCGAGCAGATGACATCCTGGCCAACCCACCGCGCCTGCCAGACCGCCAGCCTTAC 3243

                                                                                                                The present sequence encodes a human polypeptide which is a potent anglogeness in inhibitor, designated KED. The KED polypeptide, Kringle proteins, or a kringle derived from human tissue plasminogen activator (tPA) protein are used to inhibit anglogenesis. Kringle protein, KED or treating tumours, as well as atherosclerosis, arthritis, retinopathy and other similar diseases. KED is also useful for the treatment of disease such as bronchial vascular congestion, the treatment of disease, adult respiratory distress syndroms, castleman's disease, adult respiratory distress syndroms, haemangioma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         436

Sequence 12, Application US/09561526

Patent No. 6416758

GENERAL INFORMATION:
APPLICANT: Philip E. Thorpe
APPLICANT: Philip E. Thorpe
TITLE OF INVENTION: ANTIBODY CONJUGATE KITS FOR SELECTIVELY INHIBITING VEGF
FILE REFERENCE: 4001.002586
CURRENT APPLICANTON NUMBER: 05/131,432
PRIOR APPLICANTON NUMBER: 60/131,432
PRIOR FILING DATE: 1999-04-28
NUMBER OF SEQ ID NOS: 44
SOFTWARE: Patentin Ver. 2.0
SEQ ID NO 12
LENTH: 573
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                              485

Patent No. 6633098
GENERAL INFORMATION:
APPLICANT: Harding, E.I.
APPLICANT: Violand, B.N.
TITLE OF INVENTION: Method of producing mouse and human;
TITLE OF INVENTION: Method of producing mouse and human;
TITLE OF INVENTION: MOMBER: US/09/231,077D
CURRENT APPLICATION NUMBER: 1999-01-14
CURRENT FILING DATE: 1999-01-14
CURRENT FILING DATE: 1998-02-23
NUMBER OF EGO ID NOS: 13
SOFTWARE: FastSEQ for Windows Version 4.0
SEQ ID NO 7
TYPE: DNA
CORGANISM: human
